## Super Tricks

## Tricks-1 How to find Square of a number ending with 5 ?

After learning this you will be able to find square of a number ending
with 5 say $25,35,45$ etc. You can even try to find square of a three
digit number ending with 5 say $115,125,135,145$ etc.

## Say you want to find square of 75

Do the following:

- Multiply 5 by 5 and put 25 as your right part of the answer.
- Multiply 7 by the next higher digit i.e 8 and put 56 as your left part of the answer.
- Your answer is 5625

## You can use this formula to find square of any number ending with 5.

## Trick-2 How to find out square of an adjacent number?

You know the squares of 20, 30, 40, 50 etc. but if you are required
to calculate square of 41 or say 71 then you will scribble on paper
and try to answer the question. Can it be done mentally? Some of
you will say may be and some of you will say may not be. But if I
give you a formula then all of you will say, yes! it can be. What is
that formula..... The formula is simple and the application is
simpler.

Say you know $70^{2}=4900$

Then $71^{2}$ will be given by the following $71^{2}=70^{2}+(70+71)=$ $4900+141=5041$
or Say you know $25^{2}=625$ then $26^{2}=625+(25+26)=676$

Call at $\mathbf{+ 9 1 - 8 7 9 1 5 7 5 1 9 8}$

## Grbools ©f ©xcellence

Like above, you can find out square of a number that is one less
than the number whose square is known.

Let me show it by taking an example: Say you know $70^{2}=4900$

Then $69^{2}$ will be given by the following $69^{2}=70^{2}-(70+69)=$ $4900-139=4761$
or Say you know $25^{2}=625$ then $24^{2}=625-(25+24)=576$

Apply it to find square of a digit, which is one, less than the square
of a known digit. This works very well for the complete range of
numbers.

## Trick-3 How to find out square of a number near 100?

Numbers Less than 100
Say you want to find Square of 99.
99 is 1 away from 100. So what?

The square will be given by $99-1 / 01^{2}=9801$
Say you want to find Square of 98

98 is 2 away from 100.

Square of this will be given by $98-2 / 02^{2}=9604$
Numbers more than 100.

Say you want to find square of 102

102 is 2 away from 100 , its 2 more than 100 therefore we will add 2
more to it and the square will be given by
$102+2 / 02^{2}=10404$

After going through these three examples you should be able to understand the technique. The technique is to reduce or add as much as it is away from 100 and put square of difference on it.

## Gabools $\mathfrak{G f} \mathbb{C} x+e l l e n t e$

## Trick-4 Multiplication

The First Formula

To Multiply two digit numbers: Remember: 1. The digits on the left hand should be same. 2 . On adding the right hand digits you must get 10 .

Example: $75 \times 75$ or $36 \times 34$

The Magical Method: $75 \times 75=5625$ What did we do?

1. We first multiplied the right hand side digits $(5 \times 5)$ and wrote 25.
2. We added 1 to the left digit 7 and got 8 .
3. We then multiplied 7 by 8 and wrote the answer 56 to the left of 25 .
4. We thus arrived at the answer 5625 .

Let's try another example: $56 \times 54$

1. $6 \times 4=24$
2. $5+1=6$
3. $5 \times 6=30$

## Sthools ©f Exxellence

4. Answer: 3024

Note: What if we have to multiply $79 \times 71$ ? The answer would be 5609.

But why the extra 0 ? Because the right hand side of the answer should always have two digits.

## Trick-5 Divisibility

I am going to describe divisibility of a number by 13. In schools and coaching institutes students are taught divisibility of a number by $2,3,4,5,6,8,9$ and 11 . I hope you are all aware of this.

A number will be divisible by 2 , if it is an even number. A number will be divisible by 3 , if sum of the digits is divisible by 3 and so on and so fourth... But what about 7, 13, 17, 19 and other odd numbers?

Our contemporary mathematics is silent on this. In Vedic we have solutions for all these (surprised?)

Let me introduce 13. [Operator of 13 is 4 How?**] Find whether 1001 is divisible by 13 ?

By seeing it is difficult to say. Do the following operations:
$1001=100+1$ (last digit) $* 4$ (operator) $=104=10+4$ (last digit) $* 4$ (operator) $=26$

Since 26 is divisible by 13 therefore, 1001 is divisible by 13. What have we done here?

## Stbools ©f excellence

We separated the last digit of the number, multiplied it by the operator and added the result to the rest.
